

Machine Learning Project Grading Policy

1 Overview

The final score of the project is determined based on three components:

- quality of the written report
- correctness and reproducibility of the code
- predictive performance on the hidden test dataset

2 Grading Breakdown

Component	Weight
Project report	70%
Code quality and reproducibility	10%
Hidden test performance	20%

3 Report Evaluation

The report will be evaluated based on:

- clarity of problem description
- quality of exploratory data analysis
- correctness of preprocessing steps
- justification of modeling choices
- quality of experimental analysis

4 Code Evaluation

Submitted code should:

- run without errors
- reproduce the results reported in the report
- be well organized and readable

5 Hidden Test Evaluation

Model performance will be evaluated on a hidden test dataset. Students will not have access to the ground truth labels.

Evaluation metrics may include:

- accuracy
- precision
- recall
- F1 score

6 Academic Integrity

Students must follow the academic integrity policy of the course. Submitting copied work or identical predictions may result in penalties or a failing grade for the project.
